

GOLF TEE

ABSTRACT

5 A golf tee includes an insertion part for insertion into a ground, a
supporting tube for holding a golf ball up, and a connecting tube for
connecting the supporting tube to the insertion part with; the supporting
tube has an annular protrusion near a bottom on an inner side; the
connecting tube has several elongated gaps, which extend longitudinally
10 from a top to a lower portion to divide an outer side of the tube into
separate sections; the connecting tube has several detaining bumps on
each separate section, and is secured to a top of the insertion part at a
lower end; the supporting tube is positioned around the connecting tube
such that the annular protrusion is detained by the detaining bumps of
15 the connecting tube, and such that it is displaceable relative to the
connecting tube for adjustment of height after the annular protrusion is
released from the bumps.
